circuitAnt

Ask questions about a gate-level netlist in plain English. An LLM agent answers by running tools on OpenROAD's database.

ONE REQUEST, END TO END

1 Ask
The designer types a request. The netlist is loaded into OpenDB.

2 Plan
The LLM reads the tool schemas and picks reduce_depth.

3 Call
agent.py runs the tool inside OpenROAD's Python.

4 Edit
The tool queries and rewrites gates and nets in OpenDB.

5 Resynthesize & prove
ABC restructures the logic, then check_equivalence runs cec.

6 Answer
A #RESPONSE block, plus the netlist written back as Verilog.
